

Android Voting Application Project

This project is an Android-based Voting Application designed to provide a secure, simple, and user-friendly digital voting experience. The system uses OTP verification, face verification, and location-based validation to improve security and prevent duplicate voting.

Main Features

Feature	Description
OTP Verification	Users verify their phone number using OTP authentication.
Face Verification	Basic ML Kit face verification is used for identity checking.
Location Selection	Users select country, state, and city before voting.
Firebase Backend	Stores user data, voting status, and authentication details.
Duplicate Vote Prevention	One phone number can vote only once.
User-Friendly UI	Simple interface with clean navigation and validation messages.

Technologies Used

Android Studio, Java, XML, Firebase Authentication, Firebase Firestore, and Google ML Kit are used in this project.

The Android Voting Application helps make the voting process safer, faster, and more accessible through digital technology.
